

Integrated access control and time & attendance system

The access events, worktime data, camera streams, fire alarms, guard tours and any other security events can be monitored on the Predor software interface.

About Predor

Predor is an integrated access control and working time management system designed especially for medium and large enterprises. The number of users in the largest Predor systems exceeds 5000.

Any security event can be monitored on the Predor software interface.

- Access events
- Time and attendance
- CCTV camera streams
- Fire alarms
- Intrusion alarms
- Guard tours
- Vehicle registration

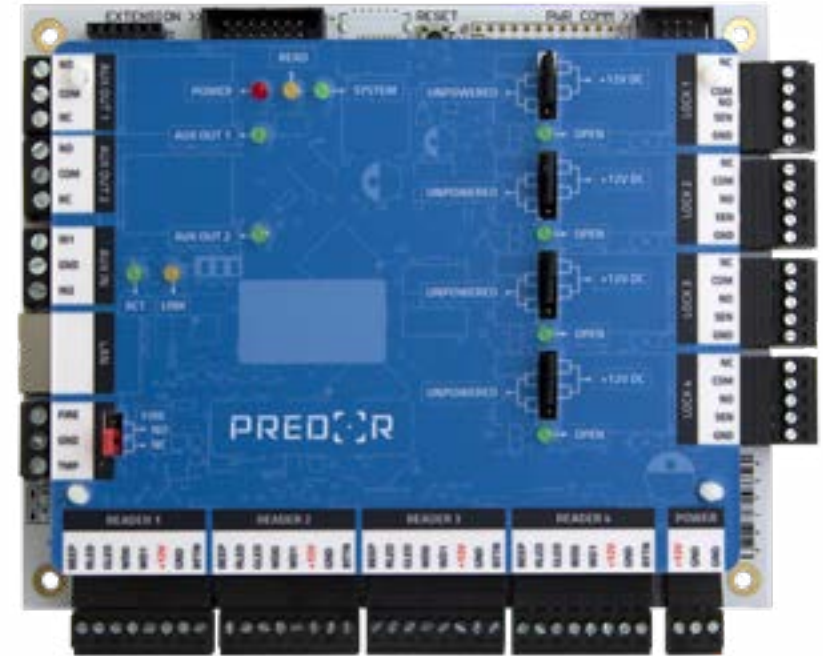

We offer free of charge software updates, though we continuously implement new features based on the feedback of our more than 1000 customers.

Customisation

We can implement any custom requirement, usually tailor the system to the customers' needs. Predor can be integrated with any third party system and translated to any language.

Predor Sentinel controller

MAIN FEATURES

- Stand-alone and online operating mode
- 130 000 events, 40 000 IDs can be stored
- Up to 4 doors can be controlled
- Automatic network discovery
- Compatible with any Wiegand card reader
- 2 programmable inputs, 2 programmable relay outputs
- Fire alarm and tamper inputs with advanced security level

Extremely powerful and robust hardware. The rate of hardware failure is less than 0,2%.

We offer free developer support and trainings for our distributor partners. Contact us for a webinar and try the demo software.

Mobile application

With the help of our free mobile application the employees' activities and the safe operation of the site can be monitored.

Using the Predor app you can...

- be immediately informed about the alerts
- manage the evacuation in case of a fire alarm
- deactivate users immediately
- browse the event list
- track the people's location
- open or lock doors remotely

ALERT

You may be notified of certain alert events – for instance of a violent intrusion – anytime, anywhere.

LOCATION OF PEOPLE

You can easily check the latecomers or just simply list the location of people.

EVACUATION LIST

In the event of a fire the system automatically generates a list of the people inside. This application helps to find out immediately who is potentially in danger.

REMOTE CONTROL

You can control any doors with your phone or you can check the door operation mode and its proper functioning.

Camera

AUTOMATED RECORDING

Photo or video can be recorded automatically, triggered by any events. For instance each entry to a certain area or forced open events can be recorded automatically.

ALERT

When an alarm is triggered, the live feed of the affected cameras will be automatically displayed. In case of future need, events are automatically recorded. You can also view the spot on a map, enabling the security guard to react more effectively.

TRACKING

In some cases it is needed to keep an eye on a person using the cameras of the facility. If we track somebody, the tracking window always displays the room, where the certain person is located. The live feed is changed when the person moves out.

Patrol management

Guards can use their own access cards while the system readers operate as checkpoints. There is no need for expensive data collectors, separate checkpoints are also not required.

Detailed reports are created and the state of the actual patrol can be seen real time. Scheduled patrols will start automatically, and the guards will be notified when they have to start.

Parking management

Automated vehicle access control combined with license plate recognition is not only faster, but more reliable than manual access control.

We offer customizable solutions for logistics centers, parking facilities, factories, warehouses and for small sized businesses, too.

Evacuation in case of a fire

- In the event of fire the system automatically generates a list of the people inside. This helps to find out immediately who is potentially in danger.
- The list is sent automatically by e-mail to the appropriate people.
- In addition the location of people can be seen real time.
- Evacuation can be done per building and even multiple can run in parallel.

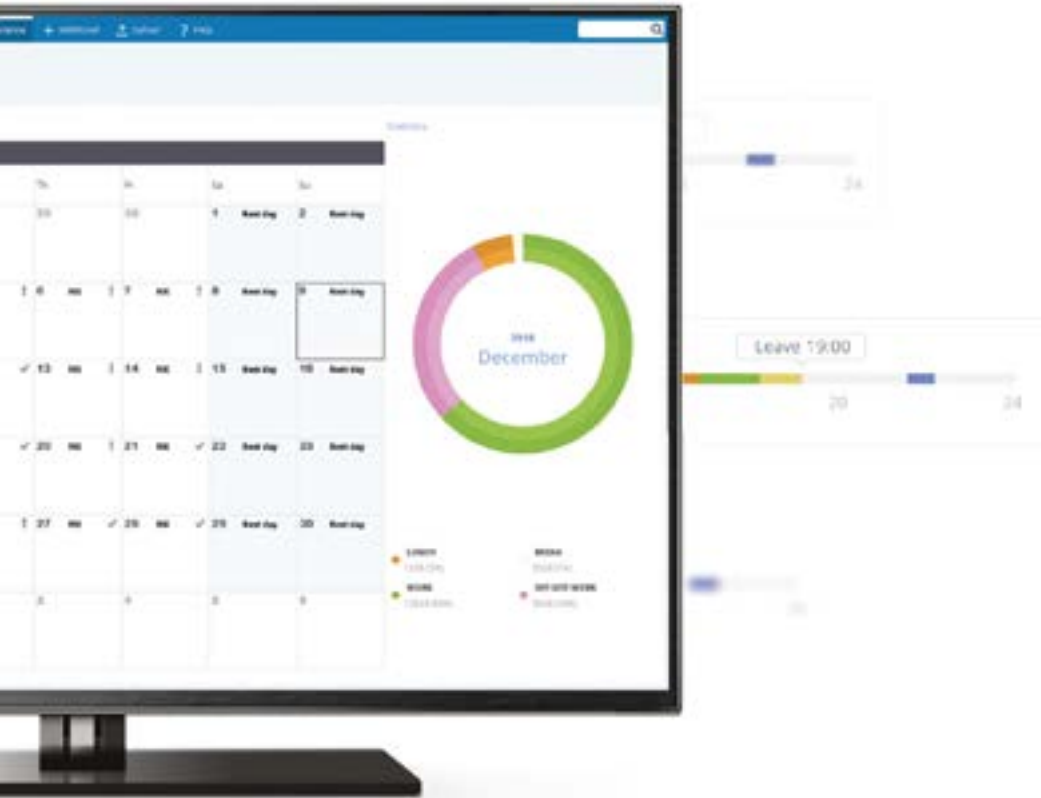

In the event of a fire or other emergency the affected building is evacuated. On the meeting point it must be determined, if there is someone still in the building.

EMERGENCY PLAN

Some facilities must be prepared to various emergencies or even an armed attack. For instance, we can initiate an emergency lockdown instantly. If necessary we can activate any pre-configured plans triggered by software, card read, button or emergency code. For example, we can lock off the attacker's path and open the escape routes for the employees.

Time & Attendance system

GRAPHICAL REPORTS

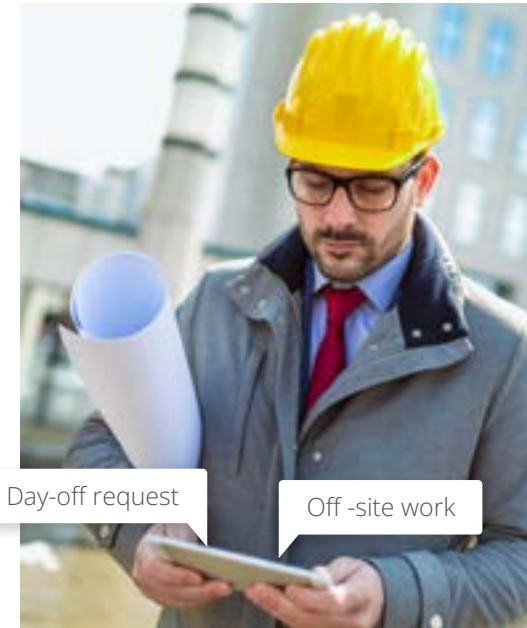

The managers can look over the important information quickly thanks to the graphical reports and diagrams. The worktime violations, late arrivals, overtime and any other activity can be highlighted.

PDF TIMESHEET

The system saves time by automatically generating the timesheets, and even sends it by e-mail. You have nothing to do but print the signable sheets.

WEB INTERFACE

- The employees can check only their own attendance data.
- They are also able to request vacation days or register remote (off-site) work periods.
- Leaders can check their subordinates' worktime balance, or schedule them into shifts.
- The subordinates' requests are accepted or rejected by the line managers.

TIME & ATTENDANCE TERMINAL

- 99 custom work codes
- Touchscreen display
- Available with encrypted built-in reader as well
- Temporary stand-alone operation
- Customizable graphical interface
- Easy to use

MOBILE BIOMETRIC TABLET

- Portable design
- Touchscreen display
- RFID card reader
- Suprema Fingerprint Sensor
- Wi-Fi support
- Stand-alone operation
- Register T&A data anywhere

Free of charge software update. No monthly or annual fees,
no hidden costs!
